Claim Rejections - 35 USC § 112

The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter, which the applicant regards as his invention.

- 1. Claims 1, 3-8, and 11-16 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. The language "partly reacting" renders the claims indefinite because it is not clear how a partially reacted system is obtained, i.e. terminating the esterification reaction prior to completion, adding excess of one reactant, etc.
- 2. Furthermore claim 12, which is dependent on claim 11, is rejected because the molar ratio of (A) and (B) extends beyond the range set for in claim 11. Claim 13 is rejected because it contains unworkable weight ranges. For example, the maximum value for (A) and the minimum values for components (B), (C), (D) and (E), sums to a total weight percentage over 100.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 3. Claims 1, 3-8, and 11-12, 14-16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Lokai et al ('983) in view of Neuhaus et al ('604). Lokai et al teach a radiation-curable urethane (meth)acrylate and the corresponding process for production (Abstract). The process consists of a) reacting an alkoxylated polyol consisting of trimethylolpropane, trimethylolethane, or pentaerythritol with (meth) acrylic acid in the presence

Art Unit: 1711

of catalyst, polymerization inhibitor, and solvent that forms an azeotrope with water, wherein the alkoxylated polyol has a range of ethoxylation between 1 and 30 and is present relative to the (meth)acrylic acid in a molar range of 1:1.1 (Col 2 lines 17-18, 61-62, 66-67, col 3 lines 9-12, col 4 lines 6-17, 50, and col 5 lines 18-20). Furthermore, patentees teach that the esterification reaction may not go to completion (Col 5 lines 26-29).

- 4. Regarding the removal of water, esterification reactions inherently posses the step of water removal in order to for the reaction to continue. The product of step a) is then neutralized and has the solvent and excess acrylic acid removed by distillation (Col 5 lines 30-31, and 45-46). The purified reaction product is then b) reacted with bisphenol A diglycidyl ether, butanediol diglycidyl ether or pentaerythritol triglycidyl ether in the presence of appropriate catalysts with resulting OH and acid numbers between 40 and 150 mg KOH/g and less than 10 mg KOH/g respectively (Col 6 lines 1-2, 23-25, 34-35, 38-39, 49-50 and col 11 lines 41-43).
- 5. The reaction product from step b) is then reacted with polyisocyanate in the presence of a catalyst and viscosity modifying reactive diluent, wherein the polyisocyanate consists of hexamethylene diisocyanate and/or isophorone diisocyanate (Col 6 lines 61-63, col 7 lines 23-24, 31-33, col 8 lines 22-24). Finally Lokai et al teach wood coating compositions that comprise the radiation-curable urethane (meth)acrylate (Col 7 lines 64-65). Regarding the claimed compound (K), although patentees teach the inclusion of an unsaturated reactive diluent, there is no teaching to react the polymer with a hydroxylalkyl(meth)acrylate compound.
- 6. Neuhaus et al teach a radiation-curable urethane acrylate coating, which is the reaction product of polyisocyanate and acrylic acid esters, wherein the resulting composition is useful in coating wood substrates (Abstract; col 7 lines 29-30). Neuhaus et al explain that urethane

Application/Control Number: 10/539,830

Art Unit: 1711

acrylate compositions which rely on reactive diluents to control the viscosity of the composition in the uncured state required large amounts of diluent, thereby degrading the urethane coating properties as well as increasing unwanted odor (Col 1 lines 20-33). These disadvantages can be overcome by replacing the reactive diluents with hydroxyalkyl (meth)acrylates, which react with free NCO groups and allow the uncured composition to maintain a low viscosity without the need for reactive diluents or solvent (Col 2 lines 12-34, 52-58). Furthermore, the hydroxyalkyl (meth)acrylates also improve the storage stability of the composition.

Page 4

- 7. Therefore it would have been obvious to one of ordinary skill in the art at the time of invention to replace the reactive diluents of Lokai et al with hydroxyalkyl(meth)acrylates based on the motivation that the resulting composition has improved shelf life, reduced odor, and does not experience other adverse effects caused by the reactive diluents, but it still able to maintain a low viscosity.
- 8. Claims 1, 3-8, and 11-16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Lokai et al ('983) in view of Neuhaus et al ('604) and in further view of Paulus et al ('991). Aforementioned, Lokai et al in view of Neuhaus et al render obvious a radiation-curable urethane (meth)acrylate and a method for its production. In particular, the first step of Lokai et al comprises reacting i) trimethylolpropane, trimethylolethane, or pentaerythritol with ii) (meth) acrylic acid in the presence of iii) catalyst, iv) polymerization inhibitor, and v) solvent that forms an azeotrope with water.
- 9. The alkoxylated polyol has a range of ethoxylation between 1 and 30, is present relative to the (meth)acrylic acid in a molar range of 1:1.5 to 1:1.1, and components iii) and iv) are present in amounts of 3% and 0.5% by weight (Lokai et al: col 4 lines 66-67; col 5 lines 1-2, 23-

Application/Control Number: 10/539,830 Page 5

Art Unit: 1711

25). Although, the esterification reaction in the first step may not go to completion, Lokai et al in view of Neuhaus et al do not specify amounts of fully nor partially esterfied alkoxylated polyol nor completely unreacted (meth)acrylic acid as claimed in claim 13.

- 10. Paulus et al teach compositions comprising light esters of acrylic acid and/or meth-acrylic acid, which when used in urethanes, are useful in wood coatings (Abstract; col 2 line 38; col 4 lines 52-58). In particular, patentees explain that these esters are generally prepared having an excess of acrylic acid relative to the hydroxyl containing compound, however if it is desired to retain some of the free OH groups, the hydroxyl containing compound are present in excess relative to the acrylic acid (Col 2 lines 42-48). Therefore it would have been obvious to have an excess of hydroxyl containing material relative to the acrylic acid in step one of Lokai et al in view of Neuhaus et al based on the motivation that it preserves free OH groups, necessary to react with the epoxy compounds of step two.
- 11. Based on the logic for excess OH groups, and the fact that the esterification reaction does not have to go to completion, it would have been obvious to arrive at the ranges of claim 13 because it has been held that where the general conditions of a claim are disclosed in the prior art, discovering the optimum or workable ranges in involves only routine skill in the art. *In re Aller*, 105 USPQ 233; *In re Reese* 129 USPQ 402. Similarly, it has been held that discovering an optimum value of a result effective variable involves only routine skill in the art. *In re Boesh*, 617 F. 2d 272, 205 USPQ 215 (CCPA 1980).

Response to Arguments

12. Applicant's arguments filed 5/22/2007 with respect to the claimed (K) compound have been considered but are most in view of the new ground(s) of rejection.

Application/Control Number: 10/539,830

Art Unit: 1711

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Benjamin J. Gillespie whose telephone number is 571-272-2472. The examiner can normally be reached on 8am-5:30pm. If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, James Seidleck can be reached on 571-272-1078. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

14. Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
